	Describe your Drinking-Water System
	The Minden Well Supply drinking water system consists of a disinfection system that uses liquid
	sodium hypochlorite injected into the raw water. Continuous monitoring for free chlorine residual
	and turbidity is carried out prior to the treated water entering the distribution system. Iron and
	manganese sequestering is accomplished using sodium silicate. Raw flow rate is monitored on both
	wells using magnetic flow meters. Well two is for standby use only and is exercised weekly to
	refresh water quality and obtain regulatory samples. A 1500 cubic meter elevated water tower
	provides storage and augments pressure to the distribution.

The Ontario Clean Water Agency aims to strictly adhere to operational and compliance limits, however certain operational circumstances may cause results to be temporarily outside of the limits. Limits that are momentarily surpassed as a result of pump start-ups, power outages/generator tests, pump rotation, calibrations, alarm verification, etc are a normal part of operations and do not indicate a true exceedance. A true exceedance will be noted and documented within the report.
